

Masters Thesis 2024 30p

Faculty of Science and Technology

A comparative study of soil temperature models, including machine learning models

Mats Hoem Olsen

Computer science

1. FORWORD

I would like to thank my advisors and friends. Also the Big Bang for happening.

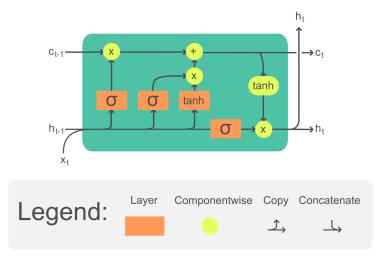

Fig. 1: LSTM cell Artist: $chevalier_english_2018$

2. THEORY

2.1. Regression model

The regression model will be for the sake of convenience be expressed as the following expresion

$$\left(\vec{F} \circ \mathbf{A}\right) \vec{\beta} = \vec{y} + \vec{\varepsilon}$$

Where \vec{F} is a vector function with following domain $\vec{F}: \mathbb{R}^{m \times n} \to \mathbb{R}^{m \times p}$ where $m, p \in \mathbb{N}$, \mathbf{A} is the data in matrix form with dimentions $\mathbb{R}^{m \times n}$, $\vec{\beta}$ is the regression terms, \vec{y} is the target (TJM), and $\vec{\varepsilon}$ is the error from modelling. The \circ operator is the composition of \vec{F} and \mathbf{A} , is a short way of writing $\vec{F}(\mathbf{A})$.

2.2. Long Short Term Memory model

3. METHOD

3.1. Source of data

For this comparative study the following data sourses will be used

- 1. Norwegian Institute of Bioeconomy Research LandbruksMeteorologisk service (LMT)
- 2. Xgeo
- 3. Norwegian Institute of Bioeconomy Research Kilden (Kilden)
- 4. The Norwegian Meteorological Institute (MET)

3.2. Dataset

The dataset is chosen from four regions in Norway; Innlandet, Vestfold, Trøndelag, and Østfold. From each region are four stations picked:

Innlandet	1. Kise	Trøndelag	1. Kvithamar
	2. Ilseng		2. Rissa
	3. Apelsvoll		3. Frosta
	4. Gausdal		4. Mære
Østfold	1. Rygge	Vestfold	1. Lier
	2. Rakkestad		2. Ramnes
	3. Tomb		3. Tjølling
	4. Øsaker		4. Sande

All stations are sampled from the date¹ 03-01 to 10-31 from 2016 to 2020. The features rain (RR), mean soil temperature at 10cm (TJM10), mean soil temperature at 20cm (TJM20), and air temperature at 2m (TM) are sampled from the LMT database. The snow parameter is sampled from MET via Xgeo for imputed values in areas where there are no messured values. The soil type, and soil texture is sampled from Kilden from Norwegian Institute of Bioeconomy Research.

3.3. Selection process

The selection process for finding these station can be compiled into these steps

- 1. Recommendation from Norwegian Institute of Bioeconomy Research
- 2. Compute the missing values in the data
- 3. Missing values analyse
- 4. Searching LMT database for alternative station candidates if current data is insufficient
- 5. If some station was replaced the repeat step 2

NA count of station: Fåvang id: 17 Total:4459

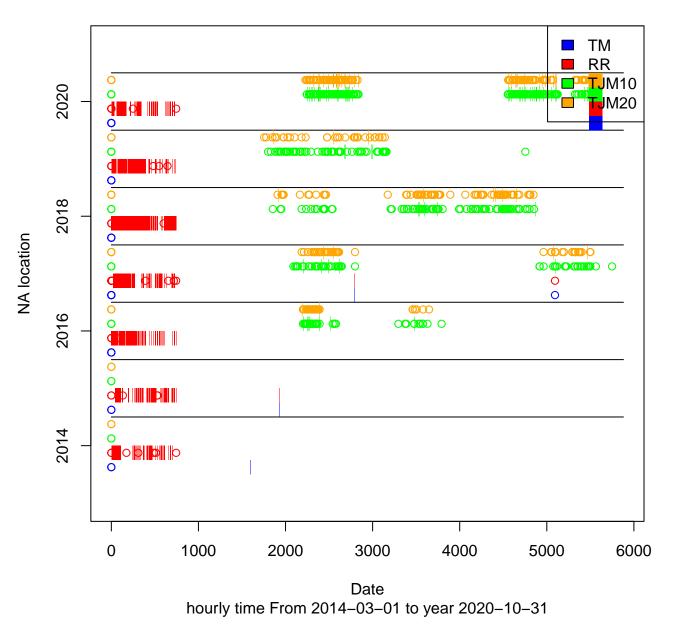

Fig. 2: Visual representation of missing values at station 17 from 2014 to 2020

The plots of stations follow a simple representation where the y-axis represent the year and the x-axis represent the index of the data as all tables are taken from the same period. A circle represent a singluar na values, while a band represent a series of 2 or more missing values. The colours represents the features used in this comperative study. This representation of the missing values will indicate sesonal, and systematic removal of data and give an overall indication of how much data is missing. To get further insight into the data a report is generated in parallel to the plots describing precisie date and time of all values and which other parameter values is also missing values in the same period. See appendix A.2 for the full detail of the report generation and appendix B for na-plots of the station chosen for this study.

3.4. Collection of data

The method used was a powershell² script that called the respective institutions servers using the "curl" program³ to send an http request for the timeseries starting from 2014 to 2020 in the interval 1 of May to 31 of October. Code for data collection can be viewed in appendix A.1. The data is stores as an either a csv file or a json file for easy retrieval and manual control of values.

3.5. labeling of stations between Nibio and MET

Since Nibio and MET have different names for the same stations one must compile a list that converts Nibio ID to MET ID. This was performed with these requests

```
1. \item \begin{lstlisting} "https://frost.met.no/sources/v0.jsonld?types=Se
\item \begin{lstlisting} "https://frost.met.no/observations/v0.csv?source
```

Where ID is the Nibio Id for the given station, Frost.ID is the MET id, ID.latitude is the latitude gathered from Nibio, ID.longitude is the longitude gathered from Nibio.

3.6. Setup of models

The models are set up in according to the relevant paper the model is fetched from, alternatively reuse the code made by the author. When importing the data to the model there will be modifying to the original code to facilitate for the model as far as it goes. Any modifications will be in the appendix under section A. The details of the models will be discussed in section??
